### TARGET NEW ENGLAND

Historical Restorations

Town of Pembroke, NH

July 12, 2018

311 Pembroke Street

Pembroke, NH 03275

Att: Reno Nadeau,

**Building & Grounds Supervisor** 

#### **PROPOSAL**

The following is a proposal for the inspection and restoration of the Pembroke Clock Tower, Pembroke, NH.

On July 12, 2018, James Doherty from Target New England, Historical Restorations, conducted an inspection of the Pembroke Clock Tower.

#### **Inspection Findings:**

- Above the clock platform, the carrying joists that hold the upper roof and bell tower are in disrepair and partial rot has sent in. This area will be replaced or repaired.
- Outside light was observed coming through openings of the wooden siding showing water damage. These openings need to be caulked and repaired.
- A significant amount of spider webs and pigeon guano was found on the upper timbers. They will be vacuumed and cleaned.
- It was found that the intensity of heat buildup in the clock tower is affecting the electrical components of the clock. This causes the clock to ring excessively. To help remedy this situation, an electric louvered ventilating fan with a thermostat will be installed.
- After inspecting the exterior paint on the four clock faces, the paint was found to be peeling and chipping. This area will be scraped, primed and re painted using Sherwin & William Industrial Paint.
- The exterior brick work was found that the joint mortar is cracking and falling off. The brick mortar will be repointed with new mortar.

Proposed Price.....\$34,420.00

This proposed price includes labor, materials, insurance and an 85 ft. man lift.

Thank you,

James Doherty, Owner

### Memorandum

David Jodoin, Town of Pembroke

Re:

4 Union Street Retaining Wall

Cc:

Jim Boisvert, Reno Nadeau

There is a modular concrete block wall on the 4 Union Street property that has some deterioration. The Town is investigating various strategies for repairs and have asked us to evaluate the wall and make suggestions on how to proceed. Following is a summary of our findings:

We visited the site (see pictures below) in July and fond the following:

#### **Existing Conditions**

- The wall supports a paved parking lot above and rests on an older concrete wall at the bottom.
- The wall is a modular concrete block wall with geogrids for structural support.
- There is deterioration of the blocks near the top of the wall. The Town replaced some of the blocks a few years ago near the top of the wall to repair similar deterioration. The Town did install a berm to direct stormwater from the parking lot away from the wall several years ago.
- There is significant deterioration at the bottom row of blocks. There was ground water flowing through
  the blocks at the interface between the blocks and concrete wall below when we were there in late July.
  The wall was wet, but the weep holes were dry but appeared to be unobstructed.
- Some of the geogrids were exposed (where bottom blocks had deteriorated) and appeared to be in excellent condition.
- The Town received an estimate from Brian Locke, LLC to spray a mortar mix with a metal lath to cover the entire face of the wall.

#### **Findings**

 The wall line and grade are still very good indicating that the wall system (blocks and geogrids) are functioning as intended structurally.

P.O. Box 432, New Boston, NH 03070

(603) 413-6650

- The deterioration near the top of the wall is consistent with salt damage. Installation of the berm probably
  helped reduce the amount of salt the wall is exposed to but the wall is certainly still exposed to salt during
  the winter.
- The constant flow of groundwater at the bottom of the wall is probably a contributor to the deterioration of the bottom row of blocks. It appears that the groundwater accumulates behind the concrete wall below the modular block wall and the flows along the top of the concrete wall under and the bottom row of blocks. The constant flow of water keeps the bottom blocks wet which is the likely cause of the deterioration. Note that the blocks above appear to be in excellent condition.

#### **Options**

- Covering the wall with a mortar mix and metal lath will cover the problem but not repair it. Furthermore, the mortar mix will probably trap more water further exacerbating the problem. We do not recommend this treatment.
- Repair options include the following:

#### Option 1 - Repair Existing Wall

- Excavate and replace the deteriorated blocks near the top of the wall being careful to remove and replace the geogrids.
- o Remove deteriorated portions of the bottom row of blocks by hand. Install a new reinforced concrete wall (8" minimum thickness) in front of the older concrete wall at the base of the block wall that extends up to the second row of blocks and tie the new wall into the existing wall by drilling and grouting rebars into the existing concrete. This should support the block wall and divert groundwater flow into the weep holes limiting further deterioration. However, without being able to view the back of the existing deteriorated blocks it is impossible to determine just how much deterioration has occurred. An easement may be required.

#### Option 2 - Complete Reconstruction

 Remove and replace the entire wall. If this option is selected a waterproofing membrane must be installed or weep holes drilled trough the existing wall to ensure groundwater flow along the bottom row of blocks is eliminated.

#### **Conclusions**

- Option 1 will repair the wall but there is uncertainty in the long-term performance of the option due to the lack of access to the back of the wall to evaluate and remove damaged blocks. So, there is some risk associated with this repair option, however, this option will be considerably less expensive than Option 2.
- Option 2 will correct the problem long term but may be more work than is necessary considering many sections of the wall are still in good condition. Any new blocks installed and existing blocks remaining should be sealed with a concrete sealer per block wall manufacturer's recommendations.
